# Challenge of wind power conversion

## Conversion

Complex, nonlinear interaction

### Input

Turbulent wind:  
Intermittent,  
extreme events

### Output

»Turbulent« power

# Statistics of extreme wind events

- Atmospheric turbulence: complex statistics
- PDFs of fluctuations  $u' = u(t) - \bar{u}$  strongly intermittent
- Very high Probabilities of extreme events
- Relevant for
  - Load changes
  - Power fluctuations

Understanding of intermittency is relevant for wind energy utilization

# Origin of intermittency

- Single 10min intervals: approx. Gaussian
- All intervals: **intermittent**
- Conditioning on  $\bar{u}$ : **little effect**
- Conditioning on  $\sigma$ : **close to Gauss**

**Intermittency in  $p(u')$  is caused by varying  $\sigma_{u'}$**

# Model for fluctuation statistics

Compose  $p(u')$  in 3 steps:

1. Gaussian PDF for fixed  $\sigma$
2. Log-normal PDF of  $\sigma$
3. Integrate over  $\sigma$

$$p(u') = \frac{1}{2\pi\alpha} \int \exp\left[-\frac{u'^2}{2\sigma^2}\right] \exp\left[-\frac{\log(\sigma/\sigma_0)^2}{2\alpha^2}\right] \frac{d\sigma}{\sigma^2}$$

## Remarks

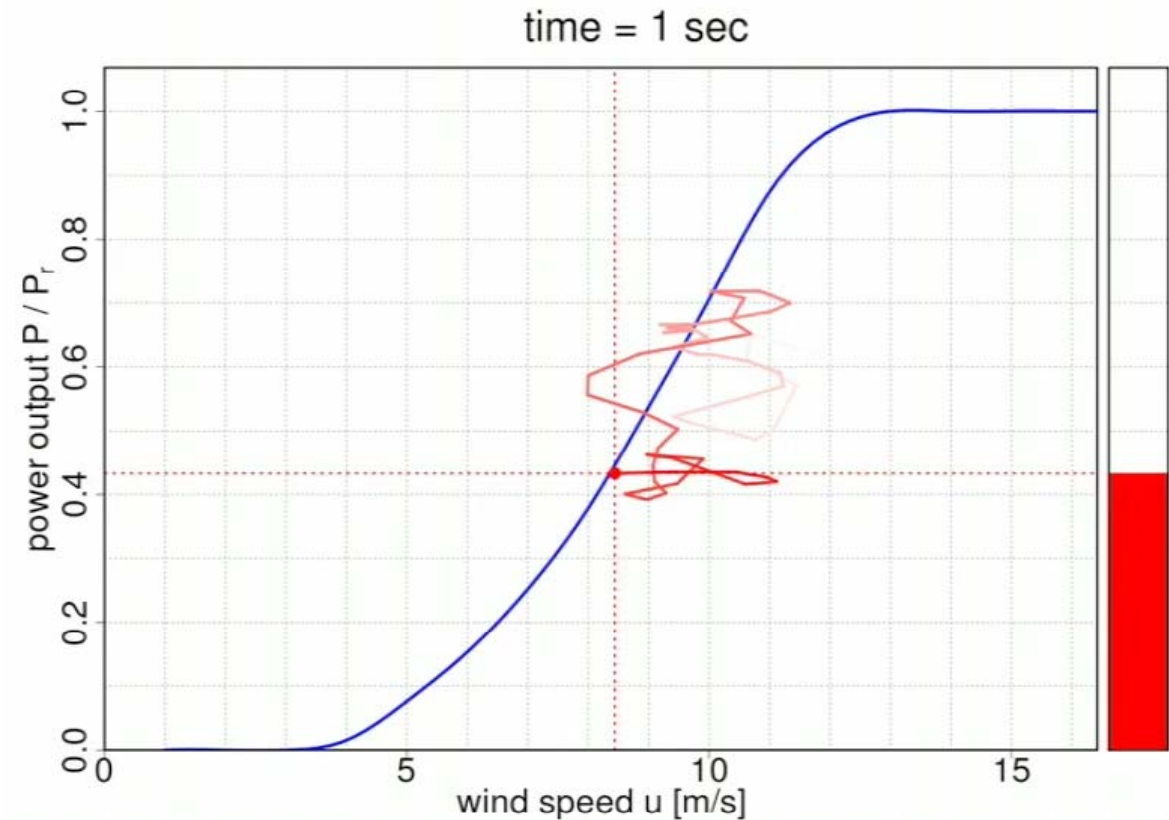

- It's a model – not a fit
- Access to high-frequency  $u'$  statistics from 10min measurements
- Possible dependency on  $\bar{u}$  (straightforward)

[Morales, Wind Energy (2011)]

# Wind energy conversion dynamics

- Highly dynamical process on short time scales
- Driven by turbulent wind
- How to obtain the **response dynamics** of WEC?
- Possible from wind and power data  $\sim 1\text{Hz}$

# Langevin power curve

- Drift function reflects average slope of power signal
- Drift field shows deterministic dynamics of energy conversion
- Stable fixed points constitute Langevin Power Curve

## Important properties

- Shows short-time dynamics ( $\sim 1s$ )
- Quick detection of changes
- Multiple fixed points possible
- State-based vs. global averaging (as of IEC 61400-12)

AV 4: REpower 5M

# Langevin power curve monitoring

- Daily LPC over 10 days, February 2011
- Wind: nacelle anemometer
- Artifact caused by wind measurement
  
- »Unfortunately«  
no turbine anomalies here

AV 4: REpower 5M

Changes in dynamical behavior are detected

# Langevin power curve monitoring

- Example showing anomaly
- FAST simulation of WindPact 1.5 turbine
- Artificial pitch failure: one blade fixed to 45°
- LPC after 1000min of failure

**(Significant) Pitch failure clearly detected**

[Muecke, PhD Thesis, to be published]

# Nacelle lidar-based Langevin power curve

- Lidar scanner developed by SWE, U Stuttgart
- Deployed at AREVA Wind M5000 prototype, BHV
- 1 day measurement

## Large potential of nacelle lidar-based power curve measurements

# Conclusions

- Model for atmospheric fluctuation PDFs  $p(u')$ 
  - High-frequency statistics from 10min data
  - Especially statistics of extreme events are well reproduced
- Langevin power curve suitable for monitoring of power performance
  - Quick and clear detection of anomalies
  - Large potential for nacelle-based lidar wind measurements
